Code Metric Visualizer Platform

The docker image for `pmccabe_visualizer` https://github.com/SergeyIvanov87/pmccabe_visualizer

The service implementation is still in progress and it has limited functionality.
The service is configured and assembled for different use-cases which are proposed through `docker compose` files. The use-cases would be described in that document later. Only local-machine (Linux tested only) docker images are shipped at the moment.
The service is supposed to monitor/to collect various metrics of code in a C/C++ project. For the moment the only `cyclomatic complexity` is introduced. For more information about `cyclomatic complexity` and how to use id please refer to an appropriate [article](https://en.wikipedia.org/wiki/Cyclomatic_complexity) or for another [repository of mine](https://github.com/SergeyIvanov87/pmccabe_visualizer)

Launching this service by targeting it on your local C/C++ project (or repository), you could leverage API populated by this service to collect, manifest and govern metric subsets.
All communication with the particular `microservice`/docker container is available either through simplest pseudo-filesystem API, which is populated in [API manifest](cyclomatic_complexity/API.fs), or using HTTP queries if you decided to employ [REST API](rest_api).
Whatever you prefered, the API subset remains the same. Thanks to the REST ideology, it is possible to generate both sets of API: requests could represent a particular hierarcy structure, thus `pmccabe_collector` leverages this idea and maps those API requests as a structure of nodes mapped to a filesystem hierarchy as directories and files inside the populated API-entry point `api.pmccabe_collector.restapi.org` resided in your project directory.
Each request can be executed as simple ACCESS-operation on a file named `exec` or `modify_this_file` in the bottom of relevant filesystem hierarchy in the same way as the Linux `/proc` pseudo-filesystem employed in order to read (and/or store) some system settings. For more information how to use psedo-filesystem API please follow this document [How-To-Use-API](HowTo/How-To-Use-API.md)
